

TravelLink Frontend — Build Progress

Last Updated: 2026-06-04 19:30 IST

Architecture Plan: [travellink frontend architecture.md](#)

Phase 1: Foundation COMPLETE

Step	File(s)	Status
Scaffold Vite + React + TS	Project root	
Tailwind v4 + PostCSS	<code>postcss.config.js</code> , <code>index.css</code>	
TypeScript DTOs (30+ interfaces)	<code>src/types/*.ts</code> (8 files + barrel)	
Axios instance + JWT interceptors	<code>src/services/api.ts</code>	
Auth service	<code>src/services/authService.ts</code>	
Auth context (login/register/logout)	<code>src/context/AuthContext.tsx</code>	
Protected route guard	<code>src/components/ProtectedRoute.tsx</code>	
Wired up <code>main.tsx</code>	BrowserRouter + AuthProvider + Toaster	

Phase 2: Auth UI IN PROGRESS

Step	File(s)	Status
Login page — split-screen + glassmorphism	<code>src/features/auth/LoginPage.tsx</code>	 Done
Register page — split-screen + glassmorphism	<code>src/features/auth/RegisterPage.tsx</code>	 Needs Update
Design tokens + custom CSS	<code>src/index.css</code>	 Done
Background image	<code>public/bg-travel.png</code>	 Generated

Custom fonts (Cardo + Great Vibes)	<code>index.css @import</code>	✓ Done
Nature gradient for "Link" text	<code>.text-nature-gradient class</code>	✓ Done
Login → backend tested & working	End-to-end verified	✓
Register → backend tested & working	End-to-end verified	✓

⚠ RegisterPage.tsx Needs Redesign

The `RegisterPage.tsx` is still using the **old design** (single-column with `auth-gradient` background, no split-screen, no travel background image, old indigo colors). It needs to be updated to match `LoginPage.tsx` :

- Split-screen layout with `flex-row-reverse` (form on left, branding on right)
- Background image (`bg-travel.png`)
- Custom fonts (Cardo for "Travel", Great Vibes for "Link")
- Nature gradient on "Link"
- Matching glassmorphism card, input, and button styling

Design Decisions Made This Session

Decision	Detail
Layout	Split-screen: Desktop = left branding + right form. Mobile = full-width background + centered card.
Background	AI-generated travel image (<code>public/bg-travel.png</code>) — sunset, ocean, mountains
Glass Card	Very light blur (<code>blur(5px)</code>), near-transparent (<code>rgba(255,255,255,0.02)</code>), top-left border highlight for 3D effect
Color Palette	Sky blue primary (<code>#0284c7</code>) for ocean/travel vibe. Moved away from indigo.

Fonts	Cardo (serif, bold) for "Travel" + Great Vibes (cursive, bold) for "Link"
"Link" gradient	5-stop nature gradient: Sky cyan → Ocean blue → Forest emerald → Mountain slate → Rock stone
Input padding	Explicit padding-left: 2rem in CSS to prevent icon/placeholder overlap
Form card	max-w-sm instead of max-w-md for tighter, more focused form
Heading	text-9xl on desktop, text-6xl on mobile

CSS Bug: Great Vibes Clipping

The "Link" text in Great Vibes gets clipped at the top (the tall "L" ascender extends above the line box). The current fix in `.text-nature-gradient`:

```
line-height: 1.4;
display: inline-block;
padding: 0.5rem 1rem;
```

This works because `display: inline-block` + `line-height: 1.4` expands the gradient clipping area, and `padding` adds extra canvas. If the user still sees clipping, try increasing `line-height` to 1.6 or `padding-top` to 0.8rem.

Next Up — Immediate TODO

1. Update `RegisterPage.tsx` to match the new split-screen design with:
 - `flex-row-reverse` layout (form left, branding right)
 - Same background image, glassmorphism, fonts, and gradient
2. Continue to Phase 3: App Shell & Dashboard

Phase 3: App Shell & Dashboard (Next)

Step	Details
AppShell component	Bottom nav (mobile) + sidebar (desktop), uses <code><Outlet /></code>

Bottom nav tabs	Home, Friends, Groups, Expenses, Map
DashboardPage	Overview cards: groups count, pending requests, upcoming trips
Shared UI components	Button, Input, Modal, Card, Avatar, Badge

Remaining Phases (4-9)

Phase	Module	Status
4	Friends (service + UI)	
5	Groups (service + UI)	
6	Expenses (service + charts)	
7	Itinerary (service + timeline)	
8	Location (SignalR + Leaflet map)	
9	Profile + Polish (dark mode, skeletons, PWA)	

Key Architecture Decisions (Carried Over)

Decision	Detail
Vite proxy	<code>/api</code> → <code>https://localhost:7150</code> (secure: false for dev certs)
API base URL	<code>/api</code> (relative, goes through Vite proxy)
Token storage	<code>localStorage</code> keys: <code>tl_token</code> , <code>tl_refresh</code> , <code>tl_user</code>
Silent refresh	Queue-based — multiple 401s trigger single refresh, others wait
Force logout	<code>window.dispatchEvent(new Event('auth_logout'))</code> decouples API from React
Toast errors	<code>unwrap<T>()</code> auto-toasts on <code>ServiceResult</code> failures AND network errors

Current File Structure

```
src/
├── components/

Dependencies

```
{
  "axios": "^1.17.0",
  "@microsoft/signalr": "^10.0.0",
  "react-router-dom": "^7.16.0",
  "sonner": "^2.0.7",
  "lucide-react": "^1.17.0",
  "tailwindcss": "^4.3.0 (dev)",
  "@tailwindcss/postcss": "^4.3.0 (dev)"
}
```

Working Mode

Important: The user prefers to write all code themselves. Provide code snippets with explanations/logic, but do NOT write directly to project files. Guide, don't execute.
